A/B Slider

User Story

Title: A/B Image Comparison Slider

As a Sitecore Content Editor, **I want to** use an A/B Slider component , **so that** I can allow users to interactively compare two product views or features within a single image frame by dragging a slider, rather than displaying two separate static images.

Acceptance Criteria

1. Backend Configuration (Content Editor)

- **AC 1.1: Image Selection:** The editor must be able to select two distinct images from the Media Library:
  - **View A Image:** The "background" or default view (usually displayed on the left side of the slider handle).
  - **View B Image:** The "overlay" or reveal view (usually displayed on the right side of the slider handle).
- **AC 1.2: Optional Text Fields:** The editor has access to the following optional text fields displayed above the image area:
  - **Headline:** (Single-line text field).
  - **Subline:** (Rich text or multi-line text field).
  - *Note:* If these fields are left empty, no extra whitespace should be rendered on the frontend.
- **AC 1.3: Default Position Setting:** The editor can define a "Initial Slider Position" value (e.g., an integer field between 0 and 100). This value represents the percentage of **View B** that is visible when the page first loads.
  - *Example:* Setting this to "10" means the slider handle starts near the left edge, revealing only 10% of View B. Setting it to "50" centers the handle.

2. Frontend Behavior (User Experience)

- **AC 2.1: Component Rendering:** The component renders View A and View B overlapping, separated by a clear, interactive vertical slider handle.
- **AC 2.2: Initial State:** Upon page load, the slider handle is positioned according to the percentage defined in the backend "Initial Slider Position" field.

- **AC 2.3: Interaction:** Users can click and drag the slider handle horizontally. Moving it left reveals more of View A; moving it right reveals more of View B.
- **AC 2.4: Responsiveness:** The component is fully responsive. The images scale correctly while maintaining their aspect ratio across mobile, tablet, and desktop breakpoints. The dragging functionality works smoothly on both mouse (desktop) and touch (mobile/tablet) interfaces.
