🤯 you can put all components in a tab - let’s check how much flexibility Sitecore can provide

## User Story: Ultimate Hybrid Tab Slider

**ID:** US-SC-TAB-04

**Priority:** High

**Theme:** Product Presentation & UX

### 1. The Story

**As a** Content Editor,

**I want** a tab component where I can choose for each tab to show **only text**, **only an image**, or **both**,

**So that** I can tailor the presentation to the specific needs of the content—whether it's a deep dive into technical specs, a high-impact product visual, or a balanced marketing message.

---

### 2. Acceptance Criteria (AC)

#### AC 1: Three Stage Layout Options

For the active content area (the "Stage"), the editor must be able to select one of the following layout modes via a dropdown:

1. **Text Only:** The Stage expands the text container to fill the full width. No image is rendered.
2. **Image Only:** The Stage displays the image at full width. No text (headline, copy, etc.) is rendered.
3. **Text + Image:** The Stage displays both.

- **Desktop:** Image and Text side-by-side (Editor can choose Image Left or Image Right).
- **Mobile:** Image and Text stack vertically (Order based on the "Image Position" setting).

#### AC 2: Navigator Modes (The "Tabs")

The navigation bar below the Stage must support two visual styles for the entire component:

- **Text Labels:** Standard text titles (e.g., "Sustainability", "Colors", "Installation").
- **Image Thumbnails:** Small preview images or color swatches.
  - *Example use case:* Clicking a "Blue" swatch updates the Stage to show the Blue product variant.

#### AC 3: Component Content Fields

Each tab item should include the following fields to support all three layout options:

- **Layout Toggle:** [Text Only | Image Only | Text + Image]
- **Main Content Image:** Used for "Image Only" or "Text + Image" modes.
- **Text Package:** Overline, Headline, Subline, Rich Text Copy.
- **CTA:** General Link (styled as button or text link).
- **Nav Indicator:** * *Label Field:* For Text Mode.
  - *Thumbnail Field:* For Image Thumbnail Mode.

#### AC 4: Slider & Playback

- **Autoplay Toggle:** Editors can enable/disable automatic cycling.
- **Looping:** If enabled, the slider returns to the first tab after the last one.
- **Pause on Interaction:** Autoplay must pause if a user hovers over the Stage or manually selects a tab.

---

### 3. Technical & Accessibility (NEO Standards)

| Feature | Requirement |
|---|---|
| ARIA Roles | `role="tablist"` for the nav, `role="tab"` for buttons, `role="tabpanel"` for the Stage. |
| Keyboard | Support `Left/Right` arrows to switch tabs and |

| | |
|---|---|
| | `Enter/Space` to select. |
| **Active State** | High-contrast visual indicator on the active tab (text underline or thumbnail border). |
| **Responsive** | The Navigator must become a horizontal swipe-container on mobile. |
| **Image Handling** | CMS should provide a warning if no image is provided while "Image Only" is selected. |

---

4. Layout Logic Table (Editor Reference)

| Mode Selected | Visible Elements | Layout Behavior |
|---|---|---|
| **Text Only** | Text Package + CTA | Centered or Left-aligned, full width. |
| **Image Only** | Main Image | Full width, edge-to-edge within container. |
| **Text + Image** | All Fields | Split 50/50 or 60/40 ratio (NEO standard). |

---

> **A Note on Color Swatches:** Since you mentioned presenting different colors, I've ensured the **Thumbnail Mode** in the navigator is optimized for small, high-detail images so that product finishes (like chrome, matte black, or brushed gold) are clearly distinguishable.

This is a complete user story for a Sitecore Tab Component Slider, designed to be handed to a development team. It includes the story statement, detailed technical acceptance criteria (AC), and considerations for the Sitecore editing experience.

---

# User Story: Sitecore Tabbed Image Slider Component

**ID:** US-SC-TAB-01

**Priority:** High

**Estimate:** [Story Points TBD by Team]

## 1. The Story

**As a** Site Visitor,

**I want** to view content presented in a tabbed slider format, where a large image and associated text are paired with a thumbnail navigation bar below,

**So that** I can browse related content in an engaging, visually appealing, and space-efficient manner without leaving the page context.

## 2. Supporting Narratives & Goals

- **For Content Editors:** "I need a flexible component where I can add multiple items (tabs). For each item, I need to easily select an image from the Media Library and fill out structured text fields (headline, copy, CTAs). Crucially, I need a simple checkbox to decide if this specific slider should autoplay or remain static until interaction."
- **For Designers:** "The layout needs to be clean. The active tab's thumbnail in the bottom navigation must be clearly highlighted so the user knows "where they are." The transition between tabs should be smooth."

---

## 3. Acceptance Criteria (AC)

The component is considered "done" when the following criteria are met on both the front-end display and the Sitecore back-end editing experience.

### AC 1: Component Structure & Layout (Front-End)

1. The component consists of two main vertical sections stacked on top of each other:
   - **Top Section (Main Display):** Shows the content of the currently active tab. This includes a large image and a text block.
   - **Bottom Section (Thumb Nav):** A horizontal navigation bar situated directly below the Top Section.
2. The **Thumb Nav** contains small thumbnail previews of the images defined in every tab belonging to the slider.

3. Clicking a thumbnail in the bottom navigation immediately makes corresponding content active in the Top Section.
4. The currently active thumbnail in the bottom navigation must have a distinct visual state (e.g., a border, opacity change, or underline) to indicate selection.

#### AC 2: Data Template & Fields (Sitecore Back-End)

The component needs a parent structure and child items.

### A. Parent Container (The Slider)

- The component must have a datasource location where editors can create child "Tab Items".
- **Configuration Field:** There must be a checkbox field named `Enable Autoplay` (or similar).
  - If checked: The slider cycles through tabs automatically on the front-end.
  - If unchecked: The slider stays on the first tab until user interaction.

### B. Child Items (The individual Tabs)

Editors must be able to add multiple child items. Each child item represents one tab and must contain the following fields:

| Field Name | Field Type | Required? | Description |
|---|---|---|---|
| Main Image | Image/Media Link | **Yes** | The large image displayed in the top section AND used for the thumbnail source in the bottom navigation. |
| Overline | Single-Line Text | No | Small text above the headline. |
| Headline | Single-Line Text | **Yes** | The main title of the tab content. |
| Subline | Single-Line Text | No | Text immediately |

| | | | |
|---|---|---|---|
| | | | below the headline. |
| Copy Text | Rich Text | No | The main body text. Editors should have basic formatting capability (bold, lists). |
| Call to Action | General Link | No | A Sitecore General Link field allowing internal/external linking. |

#### AC 3: CTA Button Styling

1. The `Call to Action` General Link field must support standard link behavior (open in new window, link description).
2. It should allow the editor to choose between at least two rendering styles via the General Link parameters or CSS classes provided in the link menu:
   - Standard Text Link style.
   - Button style (primary brand button).

#### AC 4: Slider Behavior & Autoplay

1. If `Enable Autoplay` is selected by the editor, the tabs should transition automatically every X seconds (e.g., 5 seconds, configurable in settings or fixed).
2. If Autoplay is enabled, user interaction (hovering over the main display or clicking a thumbnail) must pause the autoplay timer. Autoplay should resume upon mouse leave (if feasible) or remain paused after a manual click.
3. The transition effect between tabs should be a smooth fade or horizontal slide (Design to confirm).

#### AC 5: Responsive Design (Mobile/Tablet)

1. **Main Display:** On smaller screens, the Image and Text block in the top section should stack vertically (Image top, Text bottom).

2. **Thumb Nav:** On narrow screens where all thumbnails cannot fit horizontally, the bottom navigation should become a swipeable horizontal carousel/scroller itself, ensuring all tabs remain accessible.

#### AC 6: Experience Editor (Page Editor) Support

1. The component can be easily added to a compatible placeholder via the toolbox.
2. Editors can create new Tab Items directly from the Experience Editor interface (using "Insert" options on the component frame).
3. Text fields and images should be editable inline where possible.
4. The `Enable Autoplay` checkbox must be accessible via the component properties dialog ("Edit component properties").

#### AC 7: Accessibility Guidelines (WCAG 2.1 AA)

1. The structure should use appropriate ARIA roles for tabbed interfaces (`role="tablist"`, `role="tab"`, `role="tabpanel"`).
2. Users must be able to navigate between the thumbnails using the keyboard (Tab/Arrow keys) and activate them using Enter/Space.
3. If autoplay is enabled, there must be a mechanism for the user to pause movement (hover pausing is acceptable, but a dedicated pause button is preferred if the design allows).
4. All images must render their ALT text attributes.
